BSL
GAS TECHNOLOGIES

Pub Cellar In Line Leak Indicator.

We have found that In Line Leak Detection in pub cellars has proven savings to both the landlord and the gas supply companies.

In the UK the majority of publicans lease the beer dispense equipment from their respective gas supply companies.

For the gas companies it costs to both install the equipment and to maintain it. In many cases "servicing" relates to system leaks.

For the publican the loss of gas through system leaks is expensive. A major study by a major gas supply company demonstrated that approximately 20% of gas usage in bars was due to system leaks.

The installation of our simple beer check system into the pipework shows the publican at a glance if there are leaks that need to be addressed

How Can You Be Sure?

Leaks can occur 24 hours a day / seven days a week. Even a small leak wastes more gas in a day than is necessary to dispense two kegs of beer. With our simple In Line Device you can see instantly if you have a leak and how big the leak is.
